

chemical vapor deposition of pdf

Chemical vapor deposition (CVD) is a deposition method used to produce high quality, high-performance, solid materials, typically under vacuum. The process is often used in the semiconductor industry to produce thin films. In typical CVD, the wafer (substrate) is exposed to one or more volatile precursors, which react and/or decompose on the substrate surface to produce the desired deposit.

Chemical vapor deposition - Wikipedia

Plasma-enhanced chemical vapor deposition (PECVD) is a chemical vapor deposition process used to deposit thin films from a gas state to a solid state on a substrate. Chemical reactions are involved in the process, which occur after creation of a plasma of the reacting gases. The plasma is generally created by radio frequency (RF) (alternating current (AC)) frequency or direct current (DC ...

Note: This post can also be downloaded at the bottom of this page. Development of atomic layer deposition (ALD) processes, either to enable fabrication of new materials by ALD, as well as to improve existing ALD materials, is an ongoing effort within the ALD-field (as was also illustrated by our recent blog post with an overview of binary materials prepared by ALD).
